

# Mathematical Induction I

# This Lecture

Last time we discussed different proof techniques.

This time we will focus on probably the most important one

- mathematical induction.

This lecture's plan:

- The idea of mathematical induction
- Basic induction proofs (e.g. equality, inequality, property, etc)
- Inductive constructions
- A "paradox"

# Proving For-All Statements

**Objective:** Prove for integer  $n$   $\forall n \geq 0 \ P(n)$

It is very common to prove statements of this form. Some Examples:

For an odd number  $m$ ,  $m^i$  is odd **for all** non-negative integer  $i$ .

**Any** integer  $n > 1$  is divisible by a prime number.

(Cauchy-Schwarz inequality) For **any**  $a_1, \dots, a_n$ , and **any**  $b_1, \dots, b_n$

$$a_1b_1 + a_2b_2 + \dots + a_nb_n \leq \sqrt{a_1^2 + a_2^2 + \dots + a_n^2} \sqrt{b_1^2 + b_2^2 + \dots + b_n^2}$$

# Universal Generalization

valid rule

$$\frac{A \rightarrow R(c)}{A \rightarrow \forall x.R(x)}$$

providing  $c$  is independent of  $A$

One way to prove a for-all statement is to prove that  $R(c)$  is true for any  $c$ , but this is often difficult to prove directly (e.g. consider the statements in the previous slide).

Mathematical induction provides another way to prove a for-all statement. It allows us to prove the statement **step-by-step**.  
Let us first see the idea in two examples.

# Odd Powers Are Odd

**Fact:** If  $m$  is odd and  $n$  is odd, then  $nm$  is odd.

**Proposition:** for an odd number  $m$ ,  $m^i$  is odd for all non-negative integer  $i$ .

$$\forall i \in \mathbb{Z} \quad \text{odd}(m^i)$$

Let  $P(i)$  be the proposition that  $m^i$  is odd.

$$\forall i \in \mathbb{Z} \quad P(i)$$

Idea of induction

- $P(1)$  is true by definition.
- $P(2)$  is true by  $P(1)$  and the fact.
- $P(3)$  is true by  $P(2)$  and the fact.
- $P(i+1)$  is true by  $P(i)$  and the fact.
- So  $P(i)$  is true for all  $i$ .

# Idea of Induction

Objective: Prove  $\forall n \geq 0 \ P(n)$

This is to prove

$$\underline{P(0)} \wedge \underline{P(1)} \wedge \underline{P(2)} \wedge \dots \wedge \underline{P(n)} \dots$$

The diagram shows the sequence of propositions  $P(0) \wedge P(1) \wedge P(2) \wedge \dots \wedge P(n) \dots$ . Each term  $P(k)$  is underlined. Red curved arrows connect the underlined terms, starting from  $P(0)$  and pointing to  $P(1)$ , then from  $P(1)$  to  $P(2)$ , and so on, illustrating the inductive step where the truth of  $P(k)$  is used to prove  $P(k+1)$ .

The idea of induction is to first prove  $P(0)$  unconditionally,  
then use  $P(0)$  to prove  $P(1)$   
then use  $P(1)$  to prove  $P(2)$   
and repeat this to infinity...

# The Induction Rule

0 and (from  $n$  to  $n+1$ ),

proves 0, 1, 2, 3, ....

Very easy  
to prove

Much easier to  
prove with  $P(n)$  as  
an assumption.

induction rule  
(an axiom)

$$P(0), \forall n \in \mathbb{N} \ P(n) \rightarrow P(n+1)$$

---

$$\forall m \in \mathbb{N} \ P(m)$$

The point is to use the knowledge on smaller problems to solve bigger problems (i.e. can assume  $P(n)$  to prove  $P(n+1)$ ). Compare it with the universal generalization rule.

# This Lecture

- The idea of mathematical induction
- Basic induction proofs (e.g. equality, property, inequality, etc)
- Inductive constructions
- A “paradox”

## Proving an Equality

$$\forall n \geq 1 \quad 1^3 + 2^3 + \dots + n^3 = \left(\frac{n(n+1)}{2}\right)^2$$

Let  $P(n)$  be the induction hypothesis that the statement is true for  $n$ .

Base case:  $P(1)$  is true

Induction step: assume  $P(n)$  is true, prove  $P(n+1)$  is true.

$$\begin{aligned} & 1^3 + 2^3 + \dots + n^3 + (n+1)^3 \\ &= \left(\frac{n(n+1)}{2}\right)^2 + (n+1)^3 \quad \text{by induction} \\ &= (n+1)^2(n^2/4 + n + 1) \\ &= (n+1)^2\left(\frac{n^2 + 4n + 4}{4}\right) = \left(\frac{(n+1)(n+2)}{2}\right)^2 \end{aligned}$$

## Proving a Property

$$\forall n \geq 1, \quad 2^{2n} - 1 \text{ is divisible by } 3$$

Base Case ( $n = 1$ ):  $2^{2n} - 1 = 2^2 - 1 = 3$

Induction Step: Assume  $P(i)$  for some  $i \geq 1$  and prove  $P(i + 1)$ :

Assume  $2^{2i} - 1$  is divisible by 3, prove  $2^{2(i+1)} - 1$  is divisible by 3.

$$\begin{aligned} 2^{2(i+1)} - 1 &= 2^{2i+2} - 1 \\ &= 4 \cdot 2^{2i} - 1 \\ &= \underbrace{3 \cdot 2^{2i}} + \underbrace{2^{2i} - 1} \end{aligned}$$

Divisible by 3

Divisible by 3 by induction

## Proving an Inequality

$$\forall n \geq 2, \quad \frac{1}{\sqrt{1}} + \frac{1}{\sqrt{2}} + \dots + \frac{1}{\sqrt{n}} > \sqrt{n}$$

Base Case ( $n = 2$ ): is true

Induction Step: Assume  $P(i)$  for some  $i \geq 2$  and prove  $P(i + 1)$ :

$$\begin{aligned} & \frac{1}{\sqrt{1}} + \frac{1}{\sqrt{2}} + \dots + \frac{1}{\sqrt{n}} + \frac{1}{\sqrt{n+1}} \\ & > \sqrt{n} + \frac{1}{\sqrt{n+1}} \quad \text{by induction} \\ & = \frac{\sqrt{n}\sqrt{n+1} + 1}{\sqrt{n+1}} \\ & > \frac{\sqrt{n}\sqrt{n} + 1}{\sqrt{n+1}} = \frac{n+1}{\sqrt{n+1}} \\ & = \sqrt{n+1} \end{aligned}$$

# Cauchy-Schwarz

(Cauchy-Schwarz inequality) For any  $a_1, \dots, a_n$ , and any  $b_1, \dots, b_n$

$$a_1b_1 + a_2b_2 + \dots + a_nb_n \leq \sqrt{a_1^2 + a_2^2 + \dots + a_n^2} \sqrt{b_1^2 + b_2^2 + \dots + b_n^2}$$

Proof by induction (on  $n$ ):

Base Case: when  $n=1$ , LHS  $\leq$  RHS.

Induction step: assume true for  $\leq n$ , prove  $n+1$ .

$$\begin{aligned} & a_1b_1 + a_2b_2 + \dots + a_nb_n + a_{n+1}b_{n+1} \\ & \leq \sqrt{a_1^2 + a_2^2 + \dots + a_n^2} \sqrt{b_1^2 + b_2^2 + \dots + b_n^2} + a_{n+1}b_{n+1} \end{aligned}$$

$$\leq \sqrt{a_1^2 + a_2^2 + \dots + a_n^2 + a_{n+1}^2} \sqrt{b_1^2 + b_2^2 + \dots + b_n^2 + b_{n+1}^2}$$

How to get to this step?

# Cauchy-Schwarz

(Cauchy-Schwarz inequality) For any  $a_1, \dots, a_n$ , and any  $b_1, \dots, b_n$

$$a_1b_1 + a_2b_2 + \dots + a_nb_n \leq \sqrt{a_1^2 + a_2^2 + \dots + a_n^2} \sqrt{b_1^2 + b_2^2 + \dots + b_n^2}$$

Induction step: assume true for  $\leq n$ , prove  $n+1$ .

$$a_1b_1 + a_2b_2 + \dots + a_nb_n + a_{n+1}b_{n+1}$$

$$\leq \underbrace{\sqrt{a_1^2 + a_2^2 + \dots + a_n^2}}_c \underbrace{\sqrt{b_1^2 + b_2^2 + \dots + b_n^2}}_d + a_{n+1}b_{n+1} \quad \text{induction}$$

$$\leq \sqrt{c^2 + a_{n+1}^2} \sqrt{d^2 + b_{n+1}^2} \quad \text{This is exactly P(2)!}$$

$$= \sqrt{a_1^2 + a_2^2 + \dots + a_n^2 + a_{n+1}^2} \sqrt{b_1^2 + b_2^2 + \dots + b_n^2 + b_{n+1}^2}$$

# Cauchy-Schwarz

(Cauchy-Schwarz inequality) For any  $a_1, \dots, a_n$ , and any  $b_1, \dots, b_n$

$$a_1b_1 + a_2b_2 + \dots + a_nb_n \leq \sqrt{a_1^2 + a_2^2 + \dots + a_n^2} \sqrt{b_1^2 + b_2^2 + \dots + b_n^2}$$

Proof by induction (on  $n$ ): When  $n=1$ , LHS  $\leq$  RHS.

When  $n=2$ , want to show  $a_1b_1 + a_2b_2 \leq \sqrt{a_1^2 + a_2^2} \sqrt{b_1^2 + b_2^2}$

$$\begin{aligned} \text{Consider } & (a_1^2 + a_2^2)(b_1^2 + b_2^2) - (a_1b_1 + a_2b_2)^2 \\ &= a_1^2b_1^2 + a_1^2b_2^2 + a_2^2b_1^2 + a_2^2b_2^2 - a_1^2b_1^2 - 2a_1b_1a_2b_2 - a_2^2b_2^2 \\ &= a_1^2b_2^2 + a_2^2b_1^2 - 2a_1b_1a_2b_2 \\ &= (a_1b_2 - a_2b_1)^2 \geq 0 \end{aligned}$$

Inductive step: use  $P(2)$  and the assumption  $P(n)$  to prove  $P(n+1)$ .

# Some Remarks

There are three important steps in mathematical induction:

- **First step:** write down clearly the inductive hypothesis  $P(n)$ .  
(This is sometimes super **IMPORTANT!!!** You will see this soon.)
- **Second step:** prove the base case  $P(1)$ ,  $P(2)$ , etc.  
(You may need to prove **more than one** base cases sometimes. E.g. Cauchy-Schwarz inequality.)
- **Inductive step:** prove the inductive case, that is,  
show  $P(n) \Rightarrow P(n+1)$   
(You need to make sure you have **used the assumption  $P(n)$** .)

# Gray Code

Can you find an ordering of all the  $n$ -bit strings in a way such that two consecutive  $n$ -bit strings differed by only one bit?

This is called the **Gray code** and has some applications.

How to construct them?

Think inductively!

# Puzzle

**Goal:** tile the squares, except one in the middle for Bill.

# Puzzle

There are only trominos (L-shaped tiles) covering three squares:

For example, for 8 x 8 puzzle we might tile for Bill this way:

# Puzzle

**Theorem:** For any  $2^n \times 2^n$  puzzle, there is a tiling with Bill in the middle.

(Do you remember that we proved  $2^{2n} - 1$  is divisible by 3?)

Proof: (by induction on  $n$ )

$P(n) ::=$  can tile  $2^n \times 2^n$  with Bill in middle.

Base case: ( $n=0$ )

(no tiles needed)

# Puzzle

Induction step: assume can tile  $2^n \times 2^n$ ,  
prove can handle  $2^{n+1} \times 2^{n+1}$ .

# Puzzle

**Idea:** It would be nice if we could control the locations of Bill.

# Puzzle

**Idea:** It would be nice if we could control the locations of the empty square.

Done!

# Puzzle

The new idea:

A stronger property

Prove that we can always find a tiling with Bill anywhere.

**Theorem B:** For any  $2^n \times 2^n$  puzzle, there is a tiling with Bill anywhere.

Clearly Theorem B implies the original Theorem.

**Theorem:** For any  $2^n \times 2^n$  puzzle, there is a tiling with Bill in the middle.

# Puzzle

**Theorem B:** For any  $2^n \times 2^n$  puzzle, there is a tiling with Bill anywhere.

Proof: (by induction on  $n$ )

$P(n) ::=$  can tile  $2^n \times 2^n$  with Bill anywhere.

Base case: ( $n=0$ )

(no tiles needed)

# Puzzle

Induction step:

Assume we can get Bill *anywhere* in  $2^n \times 2^n$ .

Prove we can get Bill anywhere in  $2^{n+1} \times 2^{n+1}$ .

# Puzzle

Induction step:

Assume we can get Bill *anywhere* in  $2^n \times 2^n$ .

Prove we can get Bill anywhere in  $2^{n+1} \times 2^{n+1}$ .

# Puzzle

**Method:** Now group the squares together,  
and fill the center with a tromino.

Done!

## Some Remarks

**Note 1:** It may help to *choose a stronger statement* (i.e.,  $P(n)$ ) than the desired result (e.g. "Bill in anywhere").

We need to prove a stronger statement, but in return we can assume a stronger property in the induction step.

**Note 2:** The induction proof of "Bill anywhere" implicitly defines a *recursive algorithm* for finding such a tiling.

# Hadamard Matrix

Can you construct an  $n \times n$  matrix with all entries  $\pm 1$  and all the rows are orthogonal to each other?

Two rows are *orthogonal* if their inner product is zero.

That is, let  $a = (a_1, \dots, a_n)$  and  $b = (b_1, \dots, b_n)$ ,

their inner product  $ab = a_1b_1 + a_2b_2 + \dots + a_nb_n$

This matrix is famous and has applications in coding theory.

To think inductively, first we come up with small examples.

$$\begin{bmatrix} 1 & 1 \\ 1 & -1 \end{bmatrix}$$

# Hadamard Matrix

Then we use an  $n \times n$  Hadamard matrix  $H_n$  to construct a  $2n \times 2n$  matrix as follows.

$$H_{2n} = \begin{bmatrix} H_n & H_n \\ H_n & -H_n \end{bmatrix} \begin{matrix} \nearrow \\ \nwarrow \end{matrix} R_1, R_2$$

We can check that  $H_{2n}$  is a Hadamard matrix:

Take rows  $R_1=(a,b)$ ,  $R_2=(c,d)$  from  $H_{2n}$ .

- If  $R_1, R_2$  are from the first  $n$  rows, then  $R_1 \cdot R_2 = a \cdot c + b \cdot d = 0 + 0 = 0$
- Similarly, if  $R_1, R_2$  are from the last  $n$  rows, then they are orthogonal.
- If  $R_1$  from the first  $n$  rows,  $R_2$  from the last  $n$  rows.
  1. If  $a \neq c, b \neq -d$ , then  $R_1 \cdot R_2 = a \cdot c + b \cdot d = 0 + 0 = 0$
  2. If  $a=b=c=-d$ , then  $R_1 \cdot R_2 = a \cdot c + b \cdot d = a \cdot a + a \cdot (-a) = 0$

# Hadamard Matrix

So by induction there is a  $2^k \times 2^k$  Hadamard matrix for any  $k$ .

Does there exist an  $n \times n$  Hadamard matrix for odd  $n$ ? **NO!**

Does there exist an  $n \times n$  Hadamard matrix for even  $n$ ? **Not sure...**

This yields the long term "Hadamard conjecture".

# Inductive Construction

This technique is very useful.

We can use it to construct:

- codes
- graphs
- matrices
- circuits
- algorithms
- designs
- proofs
- buildings
- ...

# This Lecture

- The idea of mathematical induction
- Basic induction proofs (e.g. equality, inequality, property, etc)
- Inductive constructions
- A “paradox”

# A "Paradox" (just a wrong proof)

**Theorem:** All horses have the same color.

*Proof:* (by induction on  $n$ )

Induction hypothesis:

$P(n) ::=$  any set of  $n$  horses have the same color

Base case ( $n=0$ ):

No horses, so *obviously* true!

# A "Paradox" (just a wrong proof)

(Inductive case)

Assume any  $n$  horses have the same color.

Prove that any  $n+1$  horses have the same color.

# A "Paradox" (just a wrong proof)

(Inductive case)

Assume any  $n$  horses have the same color.

Prove that any  $n+1$  horses have the same color.

# A "Paradox" (just a wrong proof)

(Inductive case)

Assume any  $n$  horses have the same color.

Prove that any  $n+1$  horses have the same color.

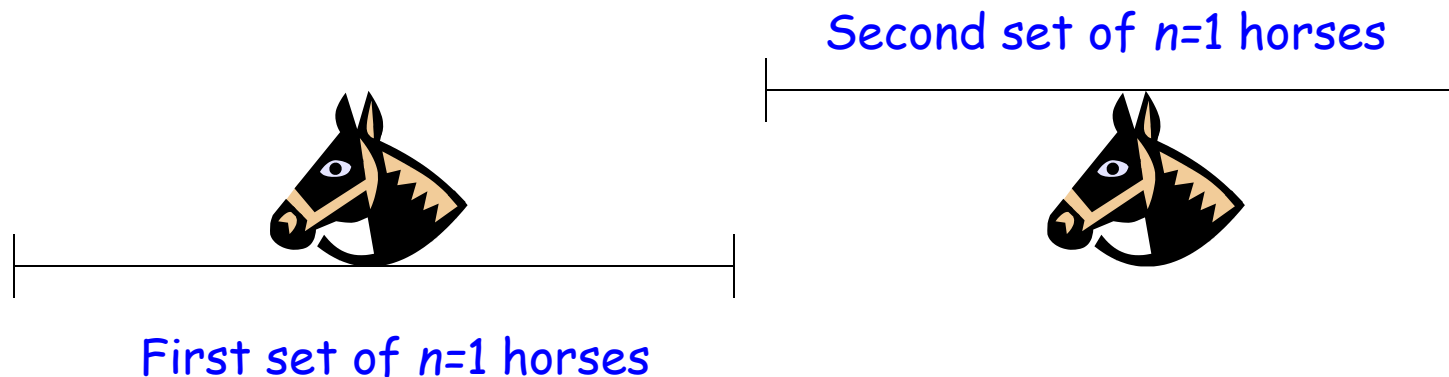

Therefore the set of  $n+1$  have the same color!

# A "Paradox" (just a wrong proof)

What is wrong?  $n=1$

Proof of  $P(n) \rightarrow P(n+1)$   
is *false* when  $n = 1$ , because the two  
horse groups *do not overlap*.

(But the proof works for all  $n \neq 1$ )

# Quick Summary

You should understand the principle of mathematical induction well,  
and do basic induction proofs like

- proving equality
- proving inequality
- proving property

Mathematical induction has a wide range of applications in computer science.

In the next lecture we will see more applications and more techniques.
